MedFlow: Program Screenshots

Milestone 5 (record updates with version history, audit log, appointments and follow-ups) | LBYCPDS E27, Group 7 | Captured November 14, 2026. Typed input is shown in green.

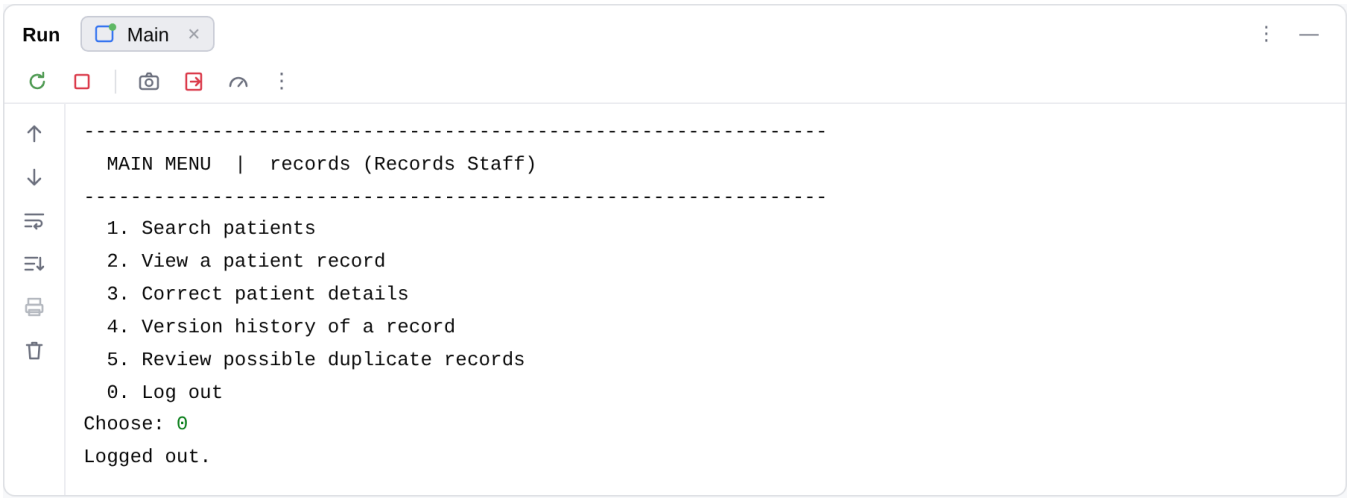

Screenshot 1. Correcting patient details (Records Staff) (part 1 of 2)

A wrong contact number is rejected and asked again. Each saved change first pushes the old record onto the version stack, so the record moves from version 1 to version 3.

Screenshot 2. Correcting patient details (Records Staff) (part 2 of 2)

Continued.

Screenshot 3. Updating clinical notes and viewing the history (Clinician) (part 1 of 2)

Only the Clinician can change allergies and relevant history. In the Clinician's history view the clinical values are shown, newest change first (top of the stack).

Screenshot 4. Updating clinical notes and viewing the history (Clinician) (part 2 of 2)

Continued.

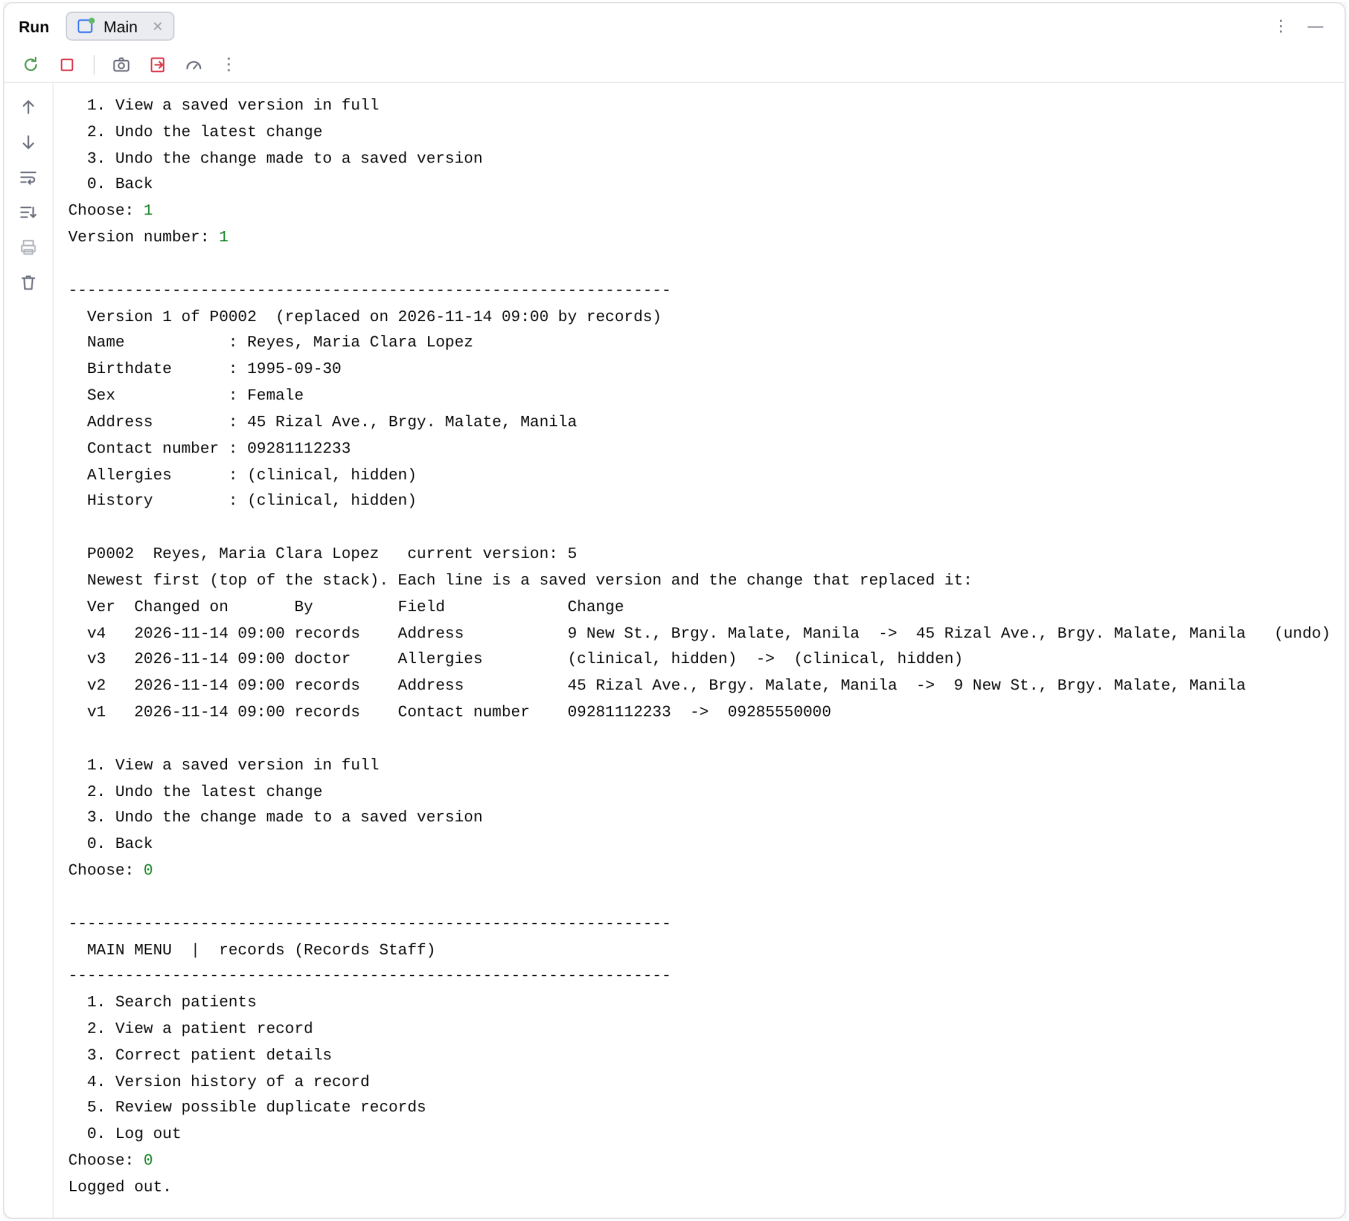

Screenshot 5. Version history and undo (Records Staff) (part 1 of 2)

Clinical values are hidden from Records Staff, and undoing a clinical change is blocked. Undoing the address change is saved as a new version 4, so nothing is popped or lost. A saved version can be viewed in full.

Screenshot 6. Version history and undo (Records Staff) (part 2 of 2)

Continued.

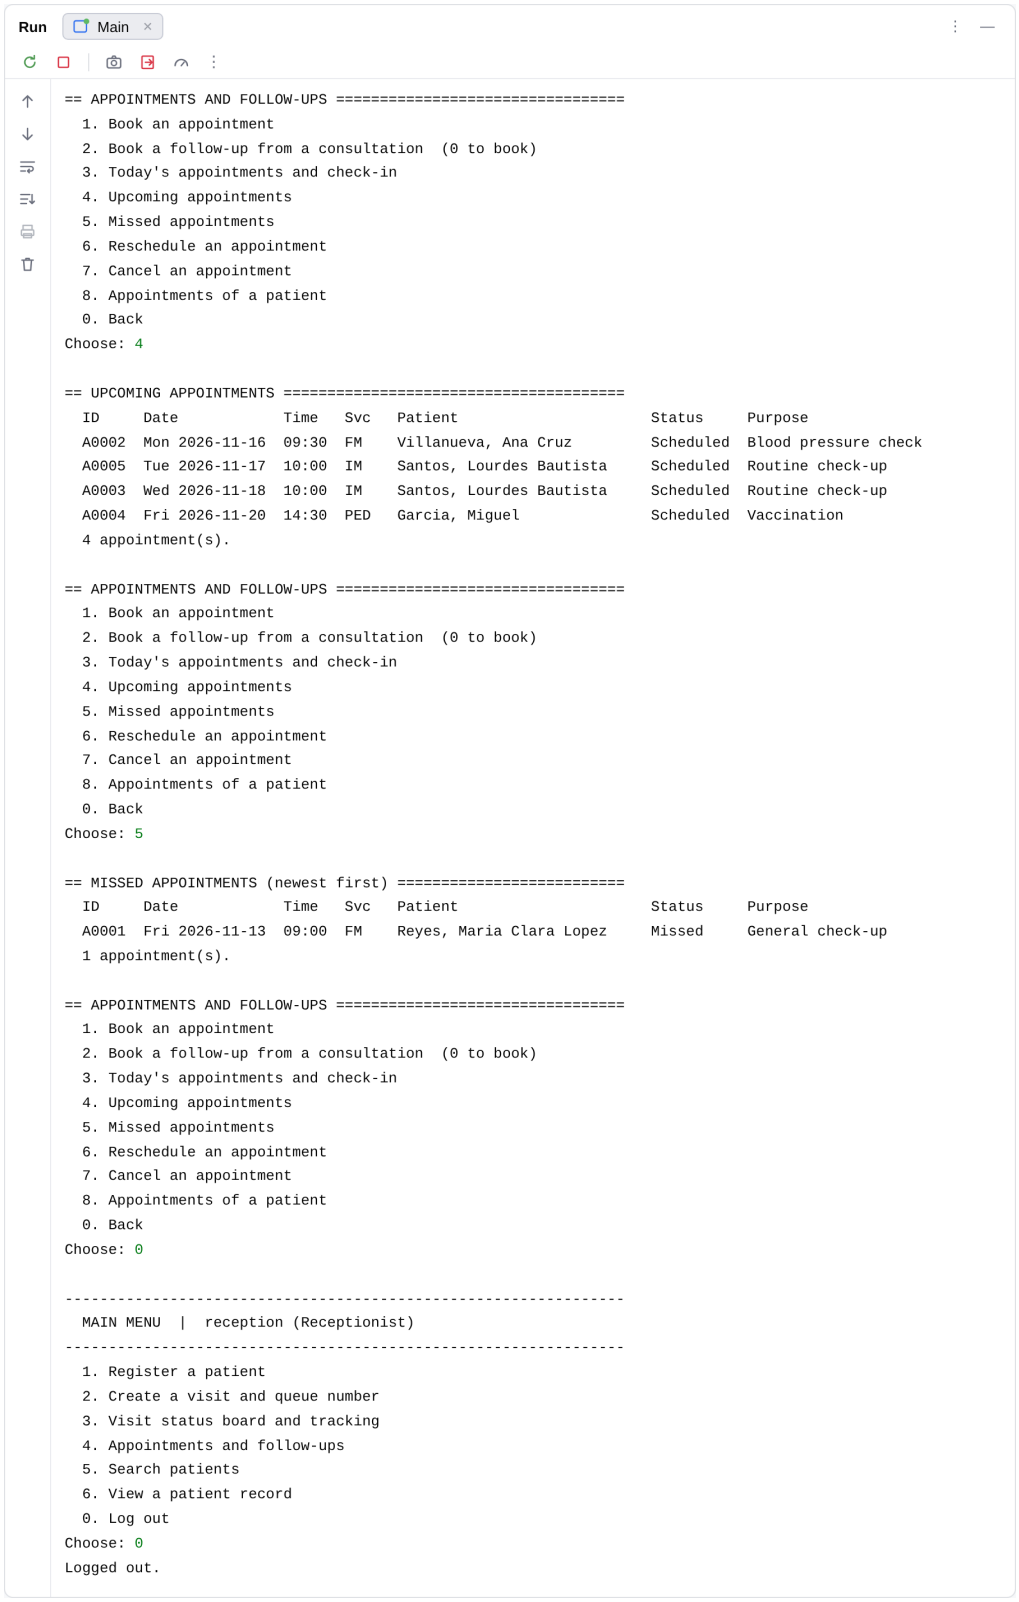

Screenshot 7. Booking an appointment, upcoming and missed lists (Receptionist) (part 1 of 2)

A past appointment with no check-in is marked Missed when the module opens. A Sunday, a wrong date format, a time outside clinic hours, and a time not on the half hour are rejected. Upcoming comes from tailMap in date and time order, missed from headMap.

Screenshot 8. Booking an appointment, upcoming and missed lists (Receptionist) (part 2 of 2)

Continued.

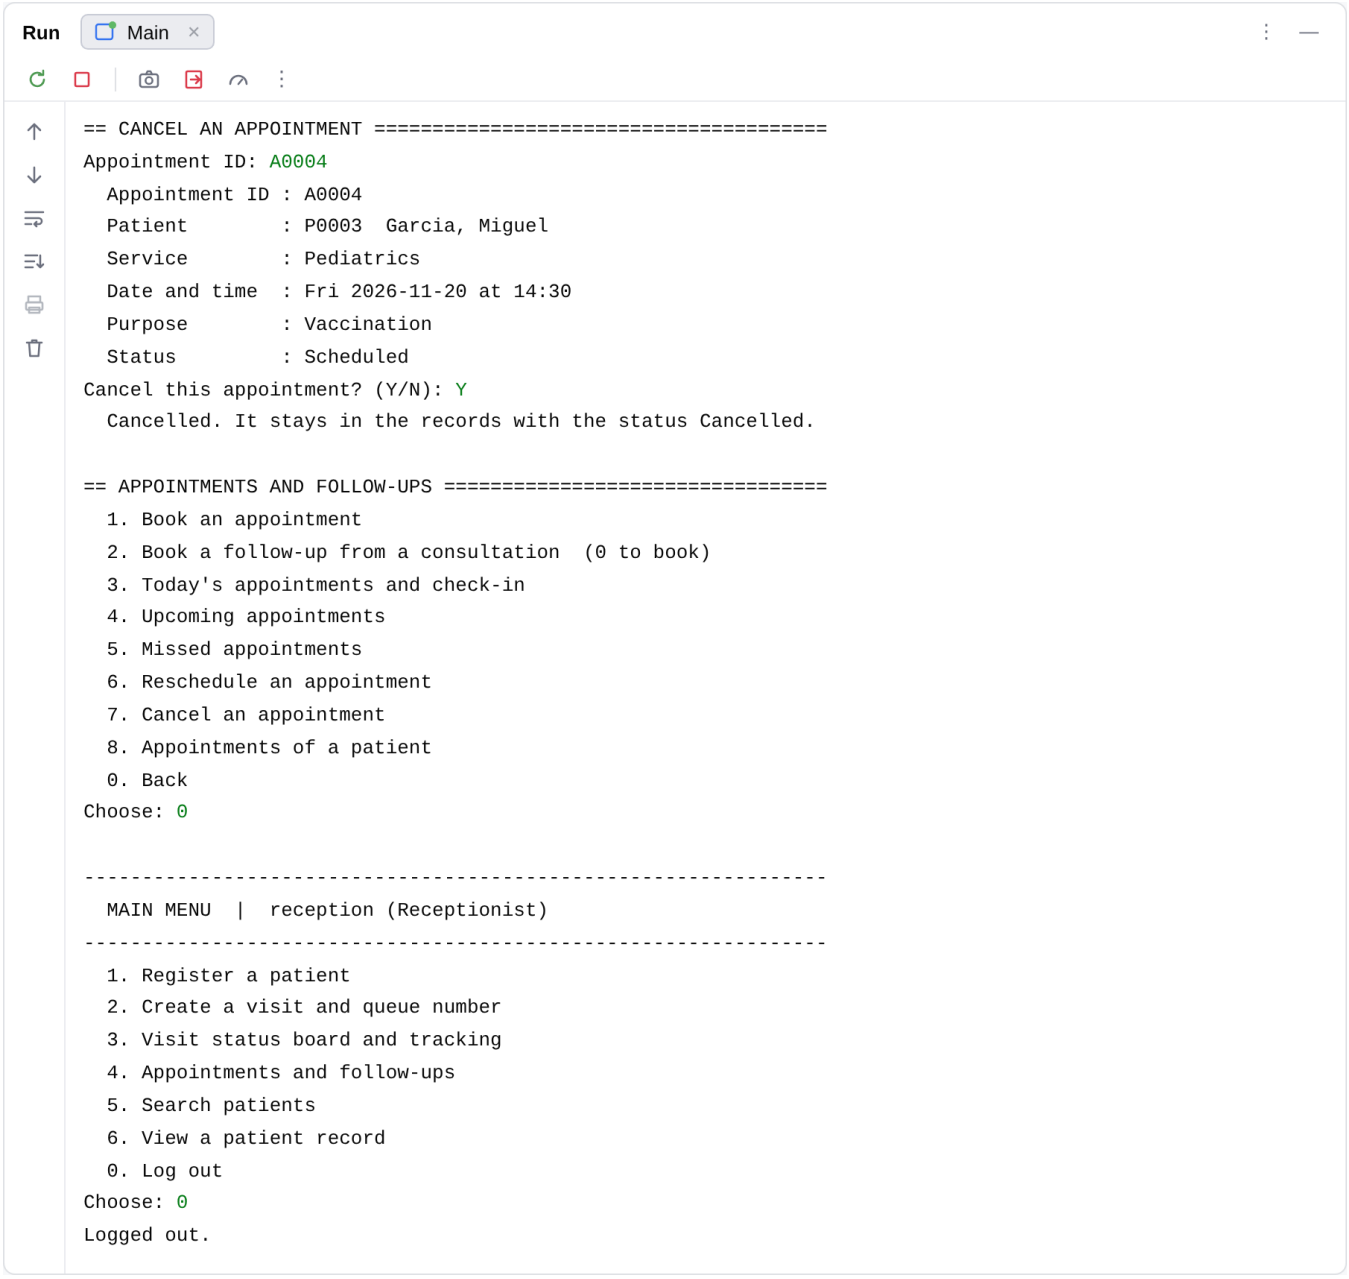

Screenshot 9. Rescheduling and cancelling (Receptionist) (part 1 of 2)

Rescheduling removes the appointment from its old TreeMap key and adds it under the new date and time. A cancelled appointment keeps its record with the status Cancelled.

Screenshot 10. Rescheduling and cancelling (Receptionist) (part 2 of 2)

Continued.

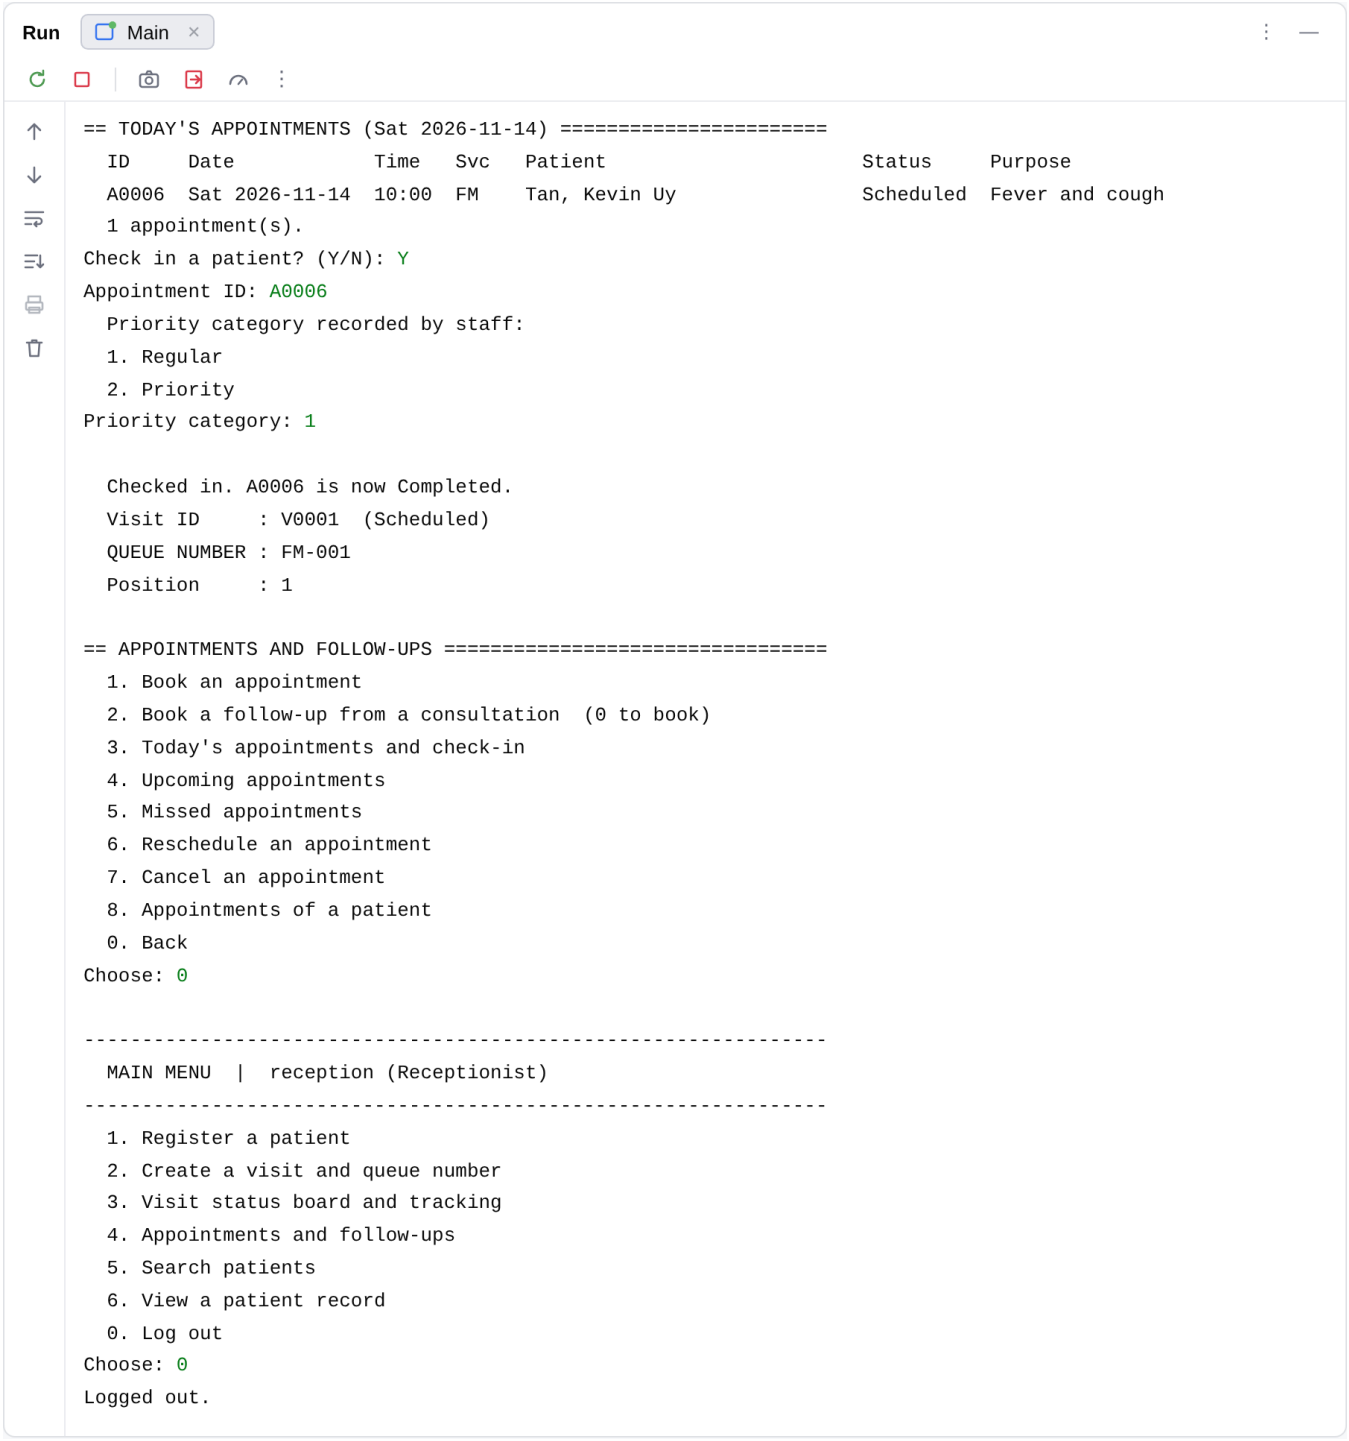

Screenshot 11. Today's appointments and check-in (Receptionist) (part 1 of 2)

Today's list comes from subMap of the day. Checking in creates a Scheduled visit with a queue number in the service line, and the appointment becomes Completed.

Screenshot 12. Today's appointments and check-in (Receptionist) (part 2 of 2)

Continued.

Screenshot 13. Consultation ending with "Follow-up visit advised" (Clinician)

The outcome screen now tells the clinician that the receptionist books the follow-up in the appointment module.

Screenshot 14. Booking the follow-up (Receptionist) (part 1 of 2)

The consultation appears in the follow-ups to book list. The booked appointment is linked to visit V0002 and leaves the list. The patient's appointments are listed in date and time order.

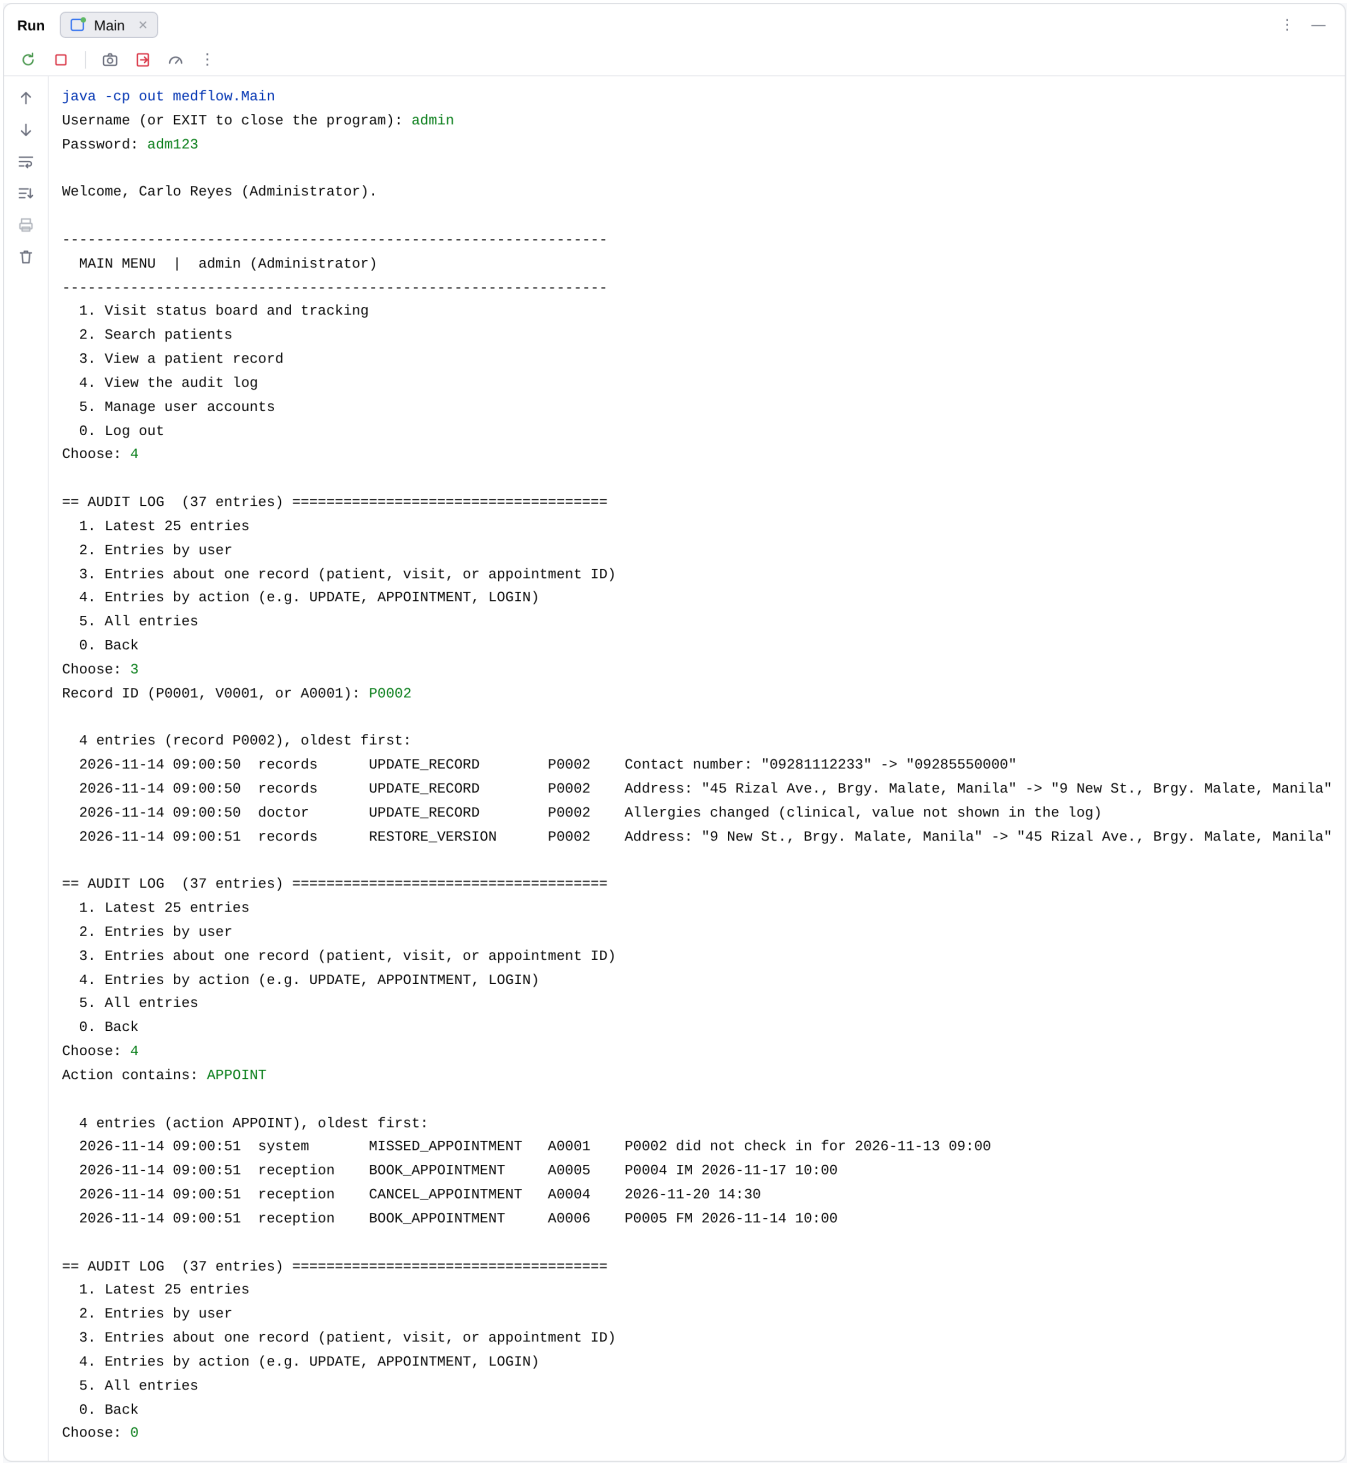

Screenshot 15. Booking the follow-up (Receptionist) (part 2 of 2)

Continued.

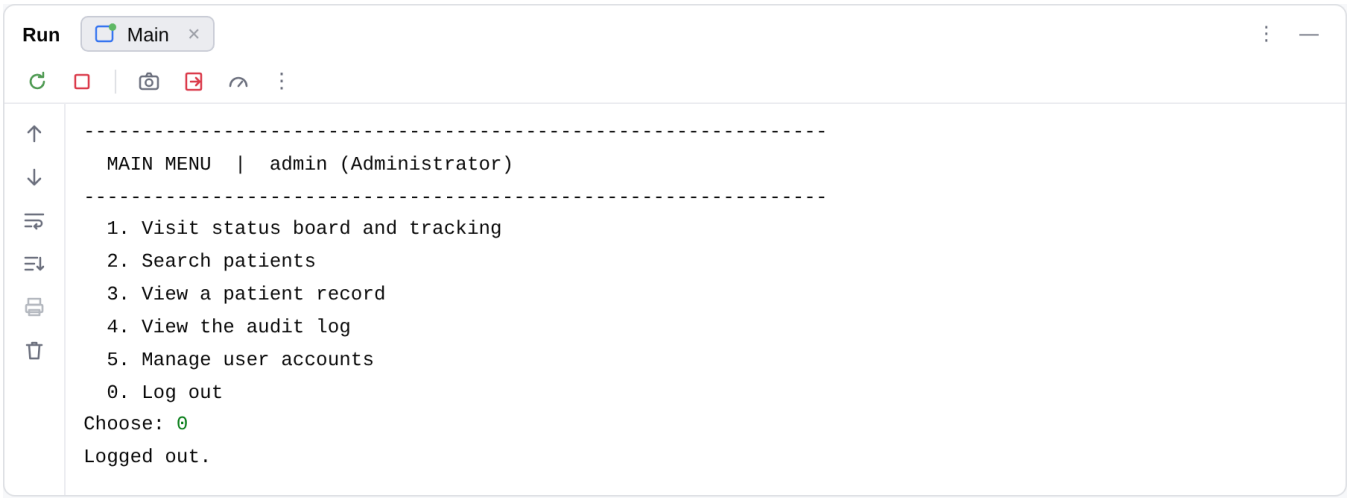

Screenshot 16. Audit log filters (Administrator) (part 1 of 2)

Filtering by record shows every change to P0002 (the clinical value is not written in the log). Filtering by action shows the booking, cancelling, and missed appointment entries.

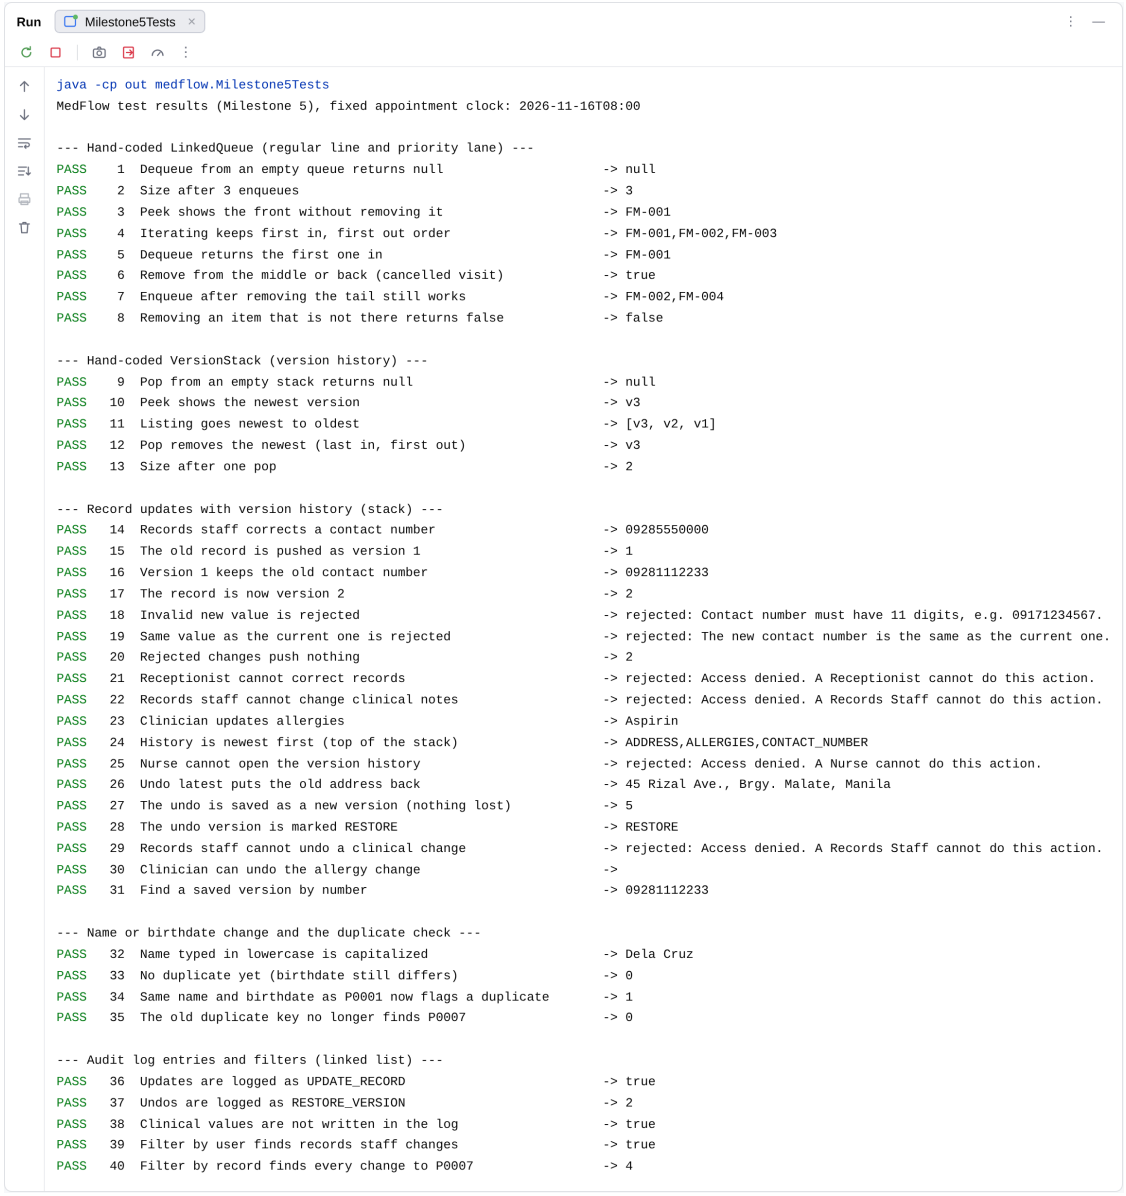

Screenshot 17. Audit log filters (Administrator) (part 2 of 2)

Continued.

Screenshot 18. Milestone 5 test results (part 1 of 2)

Hand-coded LinkedQueue and VersionStack, record updates with version history, and the duplicate check after a name or birthdate change.

Screenshot 19. Milestone 5 test results (part 2 of 2)

Audit log filters, appointment rules, reschedule and cancel, missed list, follow-ups, check-in, and saving and loading. All 81 tests passed.

Screenshot 20. Milestones 1 and 2 tests still pass

The earlier 105 tests were updated for the new save and load methods and still pass after Milestones 3 to 5.
